Role Based Access Control

- For administrators, roles provide a means of assigning administrative privileges in your Azure/Microsoft 365 environment.
- Roles provide a way to see exactly what rights are being assigned to a user or group
- Identities can be assigned multiple roles

Principle of Least Privilege

- Give out the least amount of rights, but still provide users the ability to do their job
- Microsoft always encourages this principle
- Mixed with Privileged Identity Management, you can also achieve “Just in Time” (JIT) administration using roles
