

# COURSE: Recon for Ethical Hacking / Penetration Testing & Bug Bounty

## Navigating the Art of Reconnaissance in Ethical Hacking, Penetration Testing & Bug Bounty Hunting

### Introduction:

In the ever-evolving landscape of cybersecurity, one truth remains constant: knowledge is power. Ethical hackers, penetration testers, and bug bounty hunters are driven by an insatiable curiosity to uncover vulnerabilities, safeguard systems, and contribute to a safer digital realm. Welcome to the enlightening Udemy course "Recon for Ethical Hacking / Penetration Testing & Bug Bounty." In this article, we invite you to embark on a journey of discovery through the intricacies of reconnaissance—the foundation upon which effective cybersecurity strategies are built.

### New Tools And Techniques for Passive Recon

#### 1) The Harvester:

The Harvester is a reconnaissance tool that allows hackers to gather information about email accounts, subdomains, and hostnames. This tool uses a combination of search engines and data sources to collect information that can be used for social engineering, phishing, and other attacks.

```
root@kali:~/Desktop# theharvester
Warning: Pycurl is not compiled against openssl. Wfuzz might not work correctly when fuzzing SSL sites. Check Wfuzz's documentation for more information.
.....
theharvester
.....
* TheHarvester Ver. 3.0.0
* Coded by Christian Martorella
* @Edge-Security Research
* cmartorell@edge-security.com
.....

Usage: theharvester options

-d: Domain to search or company name
-b: data source: baidu, bing, bingapi, dogpile, google, googleCSE,
    googleplus, google-profiles, linkedin, ppp, twitter, whois,
    virustotal, threatcrowd, crtsh, metcraft, yahoo, all
-s: start in result number X (default: 0)
-v: verify host name via dns resolution and search for virtual hosts
-f: save the results into an HTML and XML file (both)
-r: perform a DNS reverse query on all ranges discovered
-c: perform a DNS brute force for the domain name
-t: perform a DNS TLD expansion discovery
-m: use this DNS server
-p: port scan the detected hosts and check for Takeovers (80,443,22,21,8080)
-l: limit the number of results to work with (bing goes from 58 to 50 results,
    google 100 to 100, and ppp doesn't use this option)
-h: use SHODAN database to query discovered hosts

Examples:
theharvester -d microsoft.com -l 500 -b google -h myresults.html
theharvester -d microsoft.com -b ppp
theharvester -d microsoft -l 200 -b linkedin
theharvester -d apple.com -b googleCSE -l 500 -s 300

## 2) Recon-ng:

Recon-ng is a reconnaissance framework that provides a modular approach to passive recon. This tool can be used to gather information from multiple sources, such as search engines, social media platforms, and other data sources. Recon-ng is highly customizable, making it an excellent choice for hackers looking for a tool that can be tailored to their specific needs.
