Overview

Overview

- Define the basic terms of cryptology
- Understand cryptography within historical contexts
- Use the correct cryptographic key for a specific business requirement

SSCP Certification Examination

Domains	Weights
Security Concepts and Practices	16%
Access Controls	15%
Risk Identification, Monitoring, and Analysis	15%
Incident Response and Recovery	14%
Cryptography	9%
Network and Communication Security	16%
Systems and Application Security	15%

Defining Terms Related to Cryptology

Cryptology

The study of codes, or the art of writing and solving them.

Citation: Oxford Languages

<https://t.me/learningnets>

Cryptology Subsets

Cryptography

Secret writing

Cryptanalysis

Activities to defeat secret writing

Basic Cryptography Terms

Encrypt/Encipher

Message converted to
ciphertext/cryptogram

Decrypt/Decipher

Reverting ciphertext
to plaintext

Plaintext/Cleartext

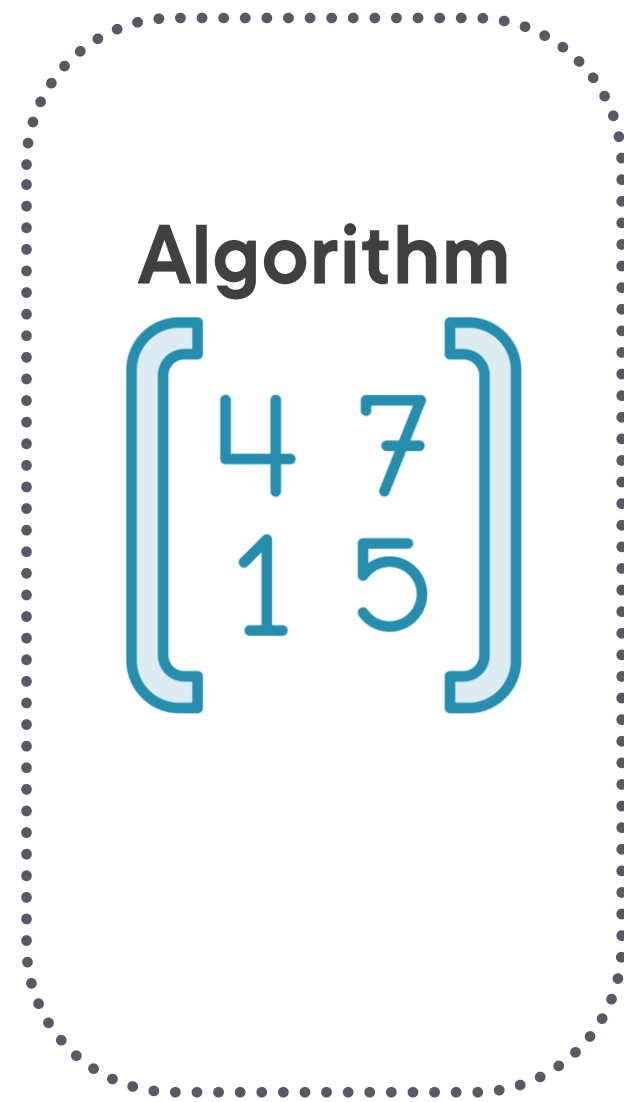

The message in
original readable form

Basic Cryptography Action

Plaintext

Cryptosystem

Ciphertext

Key/Cryptovvariable

Work Factor Implications

Key space

Length of
cryptovvariable

Avalanche effect

Minor change causes
major effect

Initialization Vector

Plaintext additive
before encrypting

Confusion

Substitution of values

Diffusion

Transposition of values

Sample Cryptographic Flaws

Cryptanalysis is aided by inherent defects and proactive actions

Collision

Hash functions produce
same digest for different
text.

Collision Issue

Plaintext

Hash Function

Digest

Collision Issue

Plaintext

“It is important that you respond **slowly.**”

“It is important that you respond quickly.”

Hash Function

Digest

7a0c65bb675
f9b66b14c7f8
a4b02a835b4
713a736232de
2a3e845c9c4
ad46fe9

Different plaintext produces the same digest

Sample Cryptographic Flaws

Cryptanalysis is aided by inherent defects and proactive actions

Collision

Hash functions produce same digest for different text.

Key Clustering

Two separate keys produce same cipher text.

Key Clustering

Plaintext

“It is important that you respond quickly.”

Cryptosystem

Algorithm

$$\begin{bmatrix} 4 & 7 \\ 1 & 5 \end{bmatrix}$$

Ciphertext

“lkl#\$hjjL,
NoKLRK@
^nbefWQ
#!”

Key 1 = @38L!R#

Key Clustering

Plaintext

Key 2 = &^t9aQ

“It is important that you respond quickly.”

Cryptosystem

Algorithm

$$\begin{bmatrix} 4 & 7 \\ 1 & 5 \end{bmatrix}$$

Ciphertext

“lkl#\$hjjL,
NoKLRK@
^nbefWQ
#!”

Different keys produces the same ciphertext

Sample Cryptographic Flaws

Cryptanalysis is aided by inherent defects and proactive actions

Collision

Hash functions produce same digest for different text.

Key Clustering

Two separate keys produce same cipher text.

Man-in-the-Middle

Monitoring and intercepting communications.

A Brief History of Cryptography

Evolution of Cryptography

Manual – Written

Mechanical – Rotating gears and cipher wheels

Electro-Mechanical – Basic circuit logic and gears

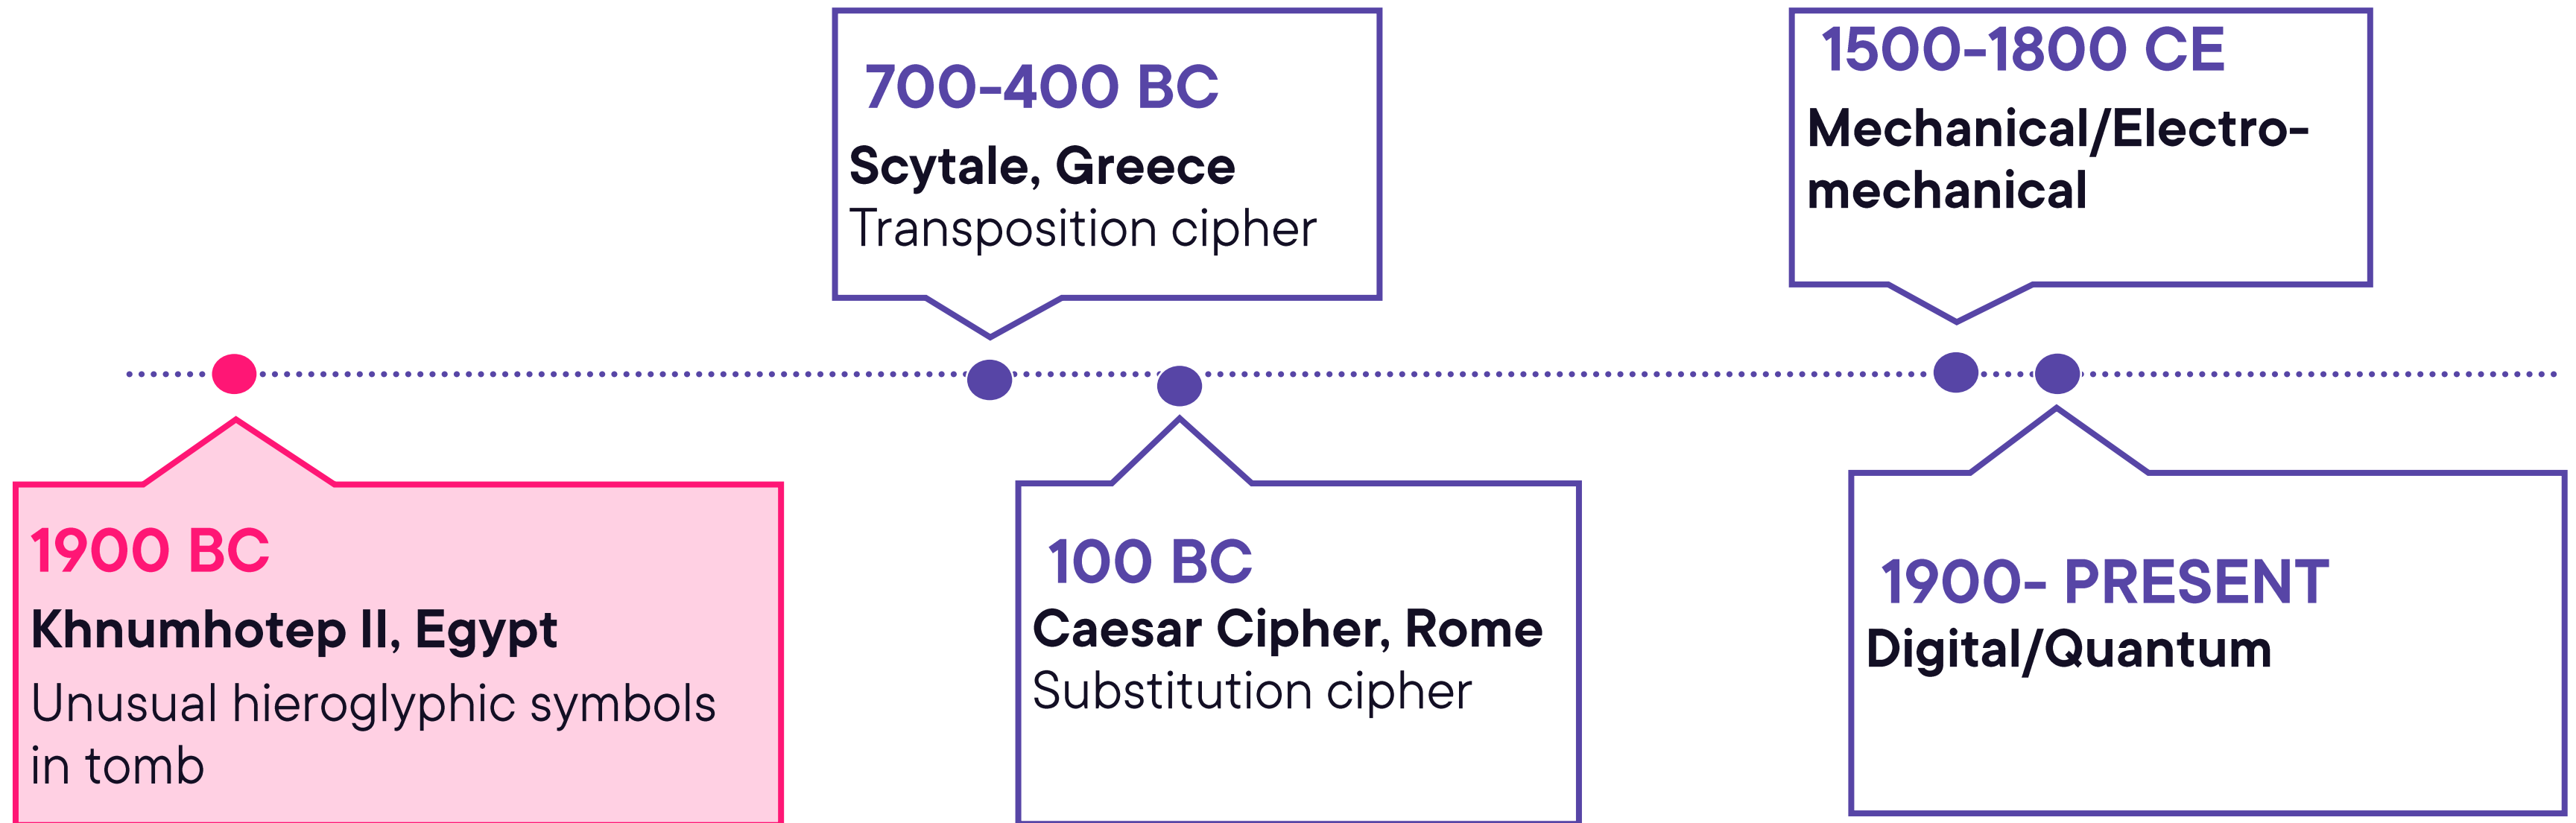

Digital – Binary logic

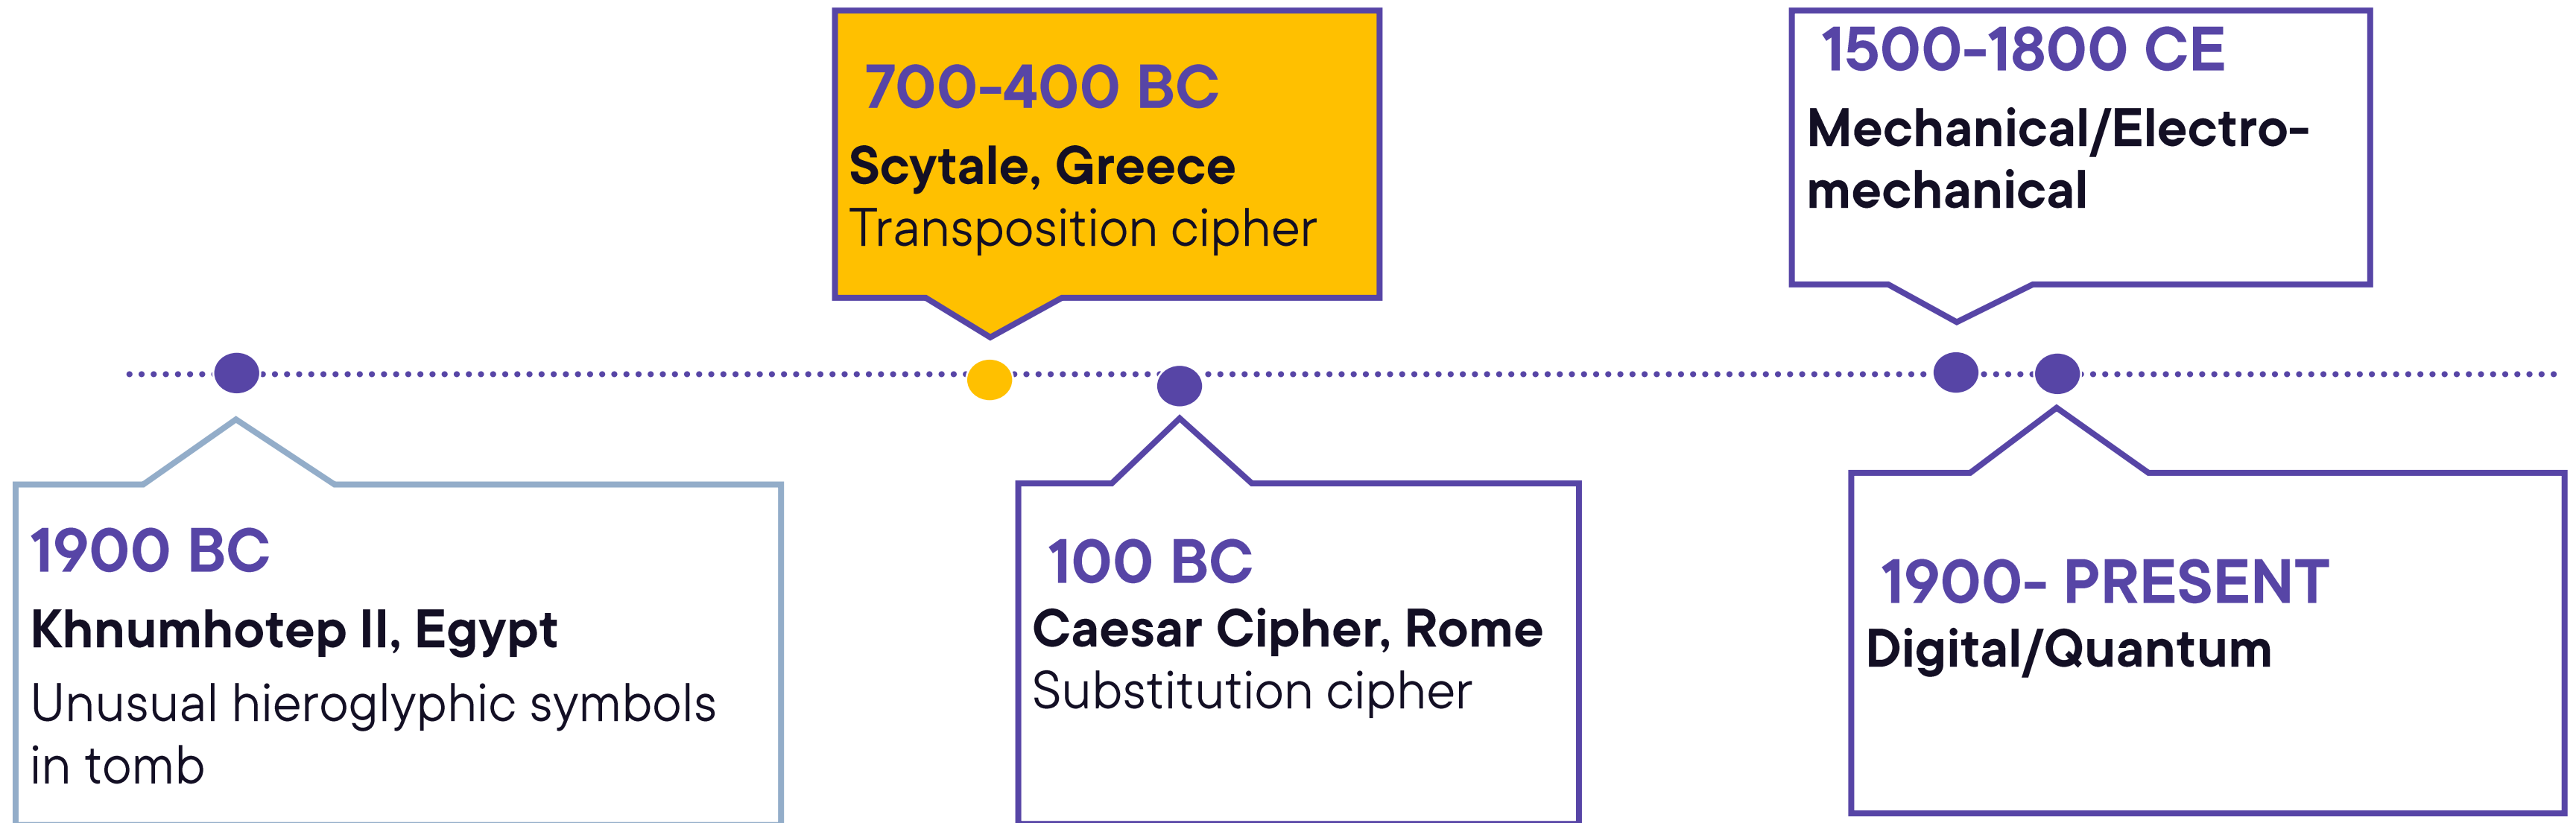

Quantum – Qubit logic

History of Significant Cryptographic Advances

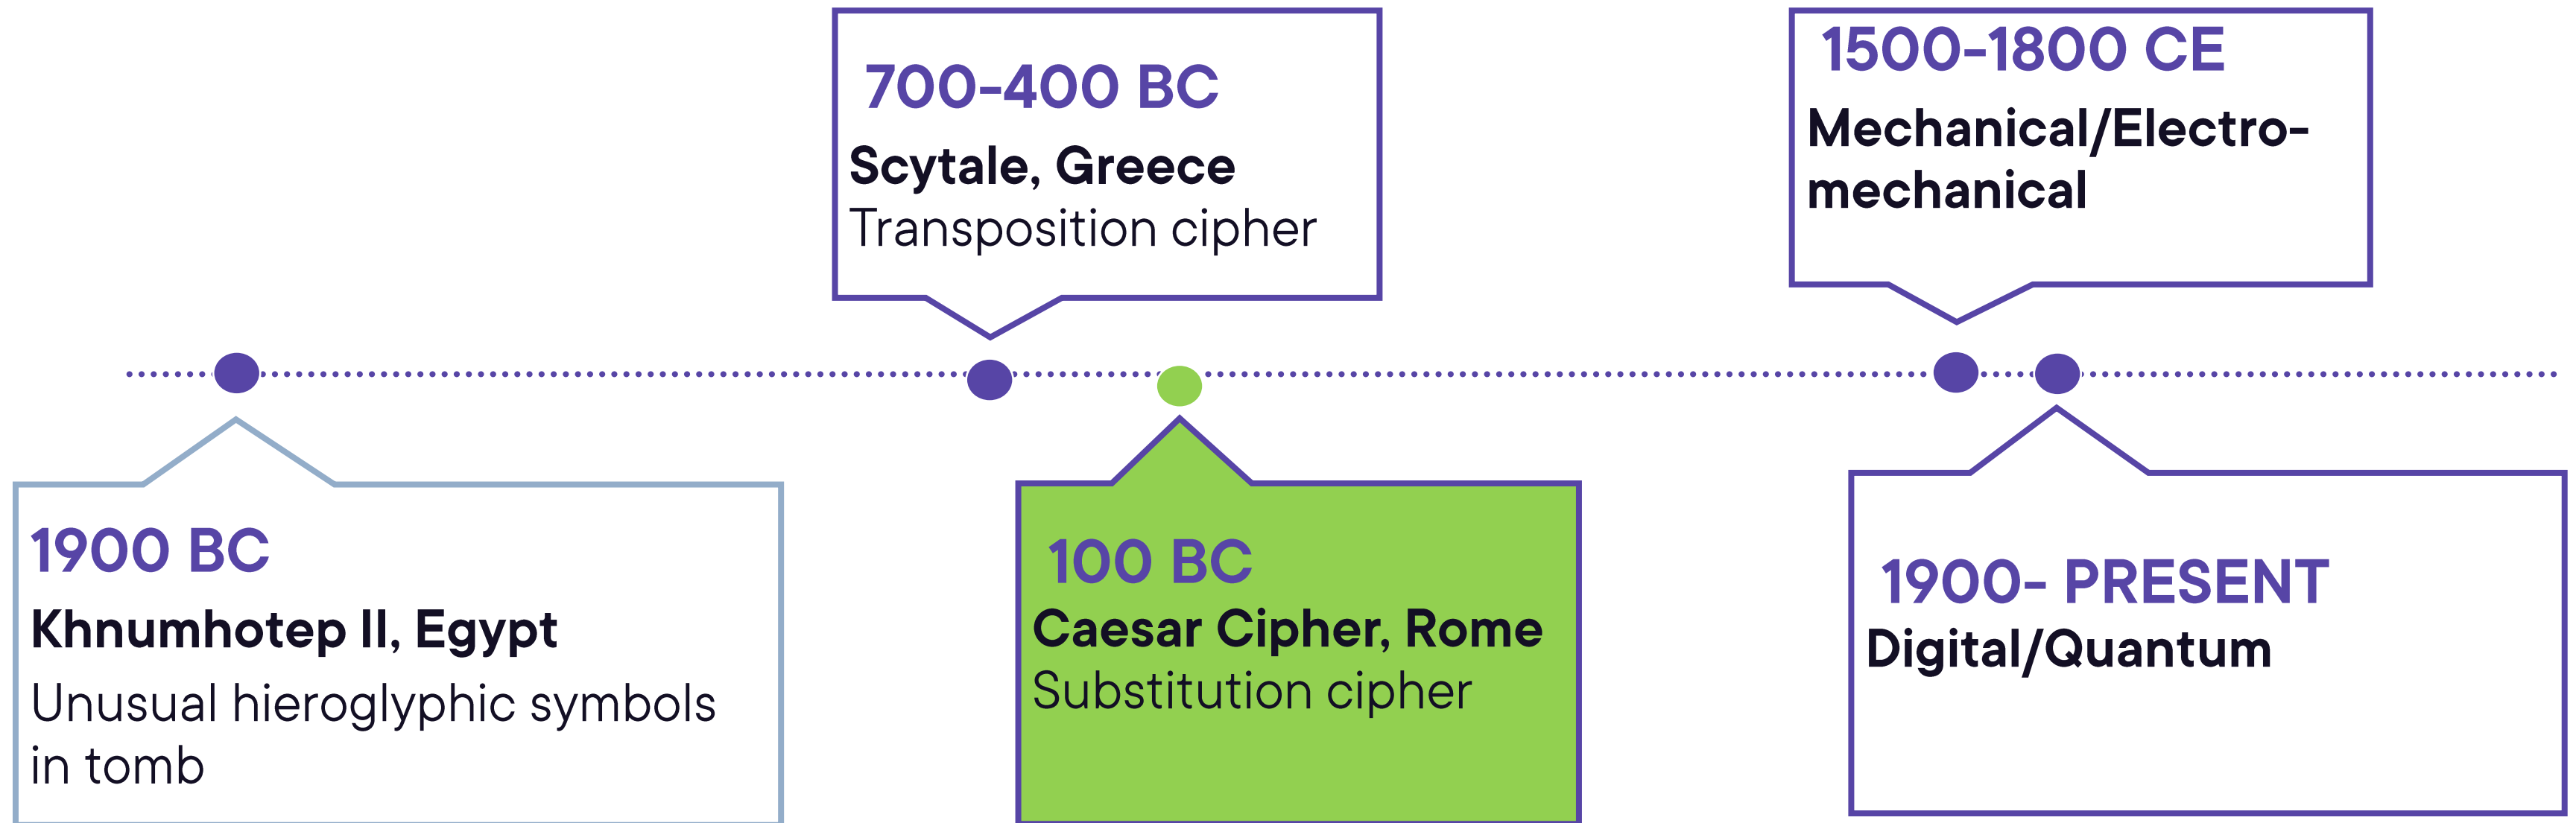

Handwritten text in a cursive script, likely a form of shorthand or a specific dialect, arranged in approximately 12 horizontal lines. The characters are dark and appear to be written on a light-colored, textured surface. The script is highly stylized and difficult to decipher without a key.

History of Significant Cryptographic Advances

History of Significant Cryptographic Advances

Caesar Cipher at Work

Plaintext

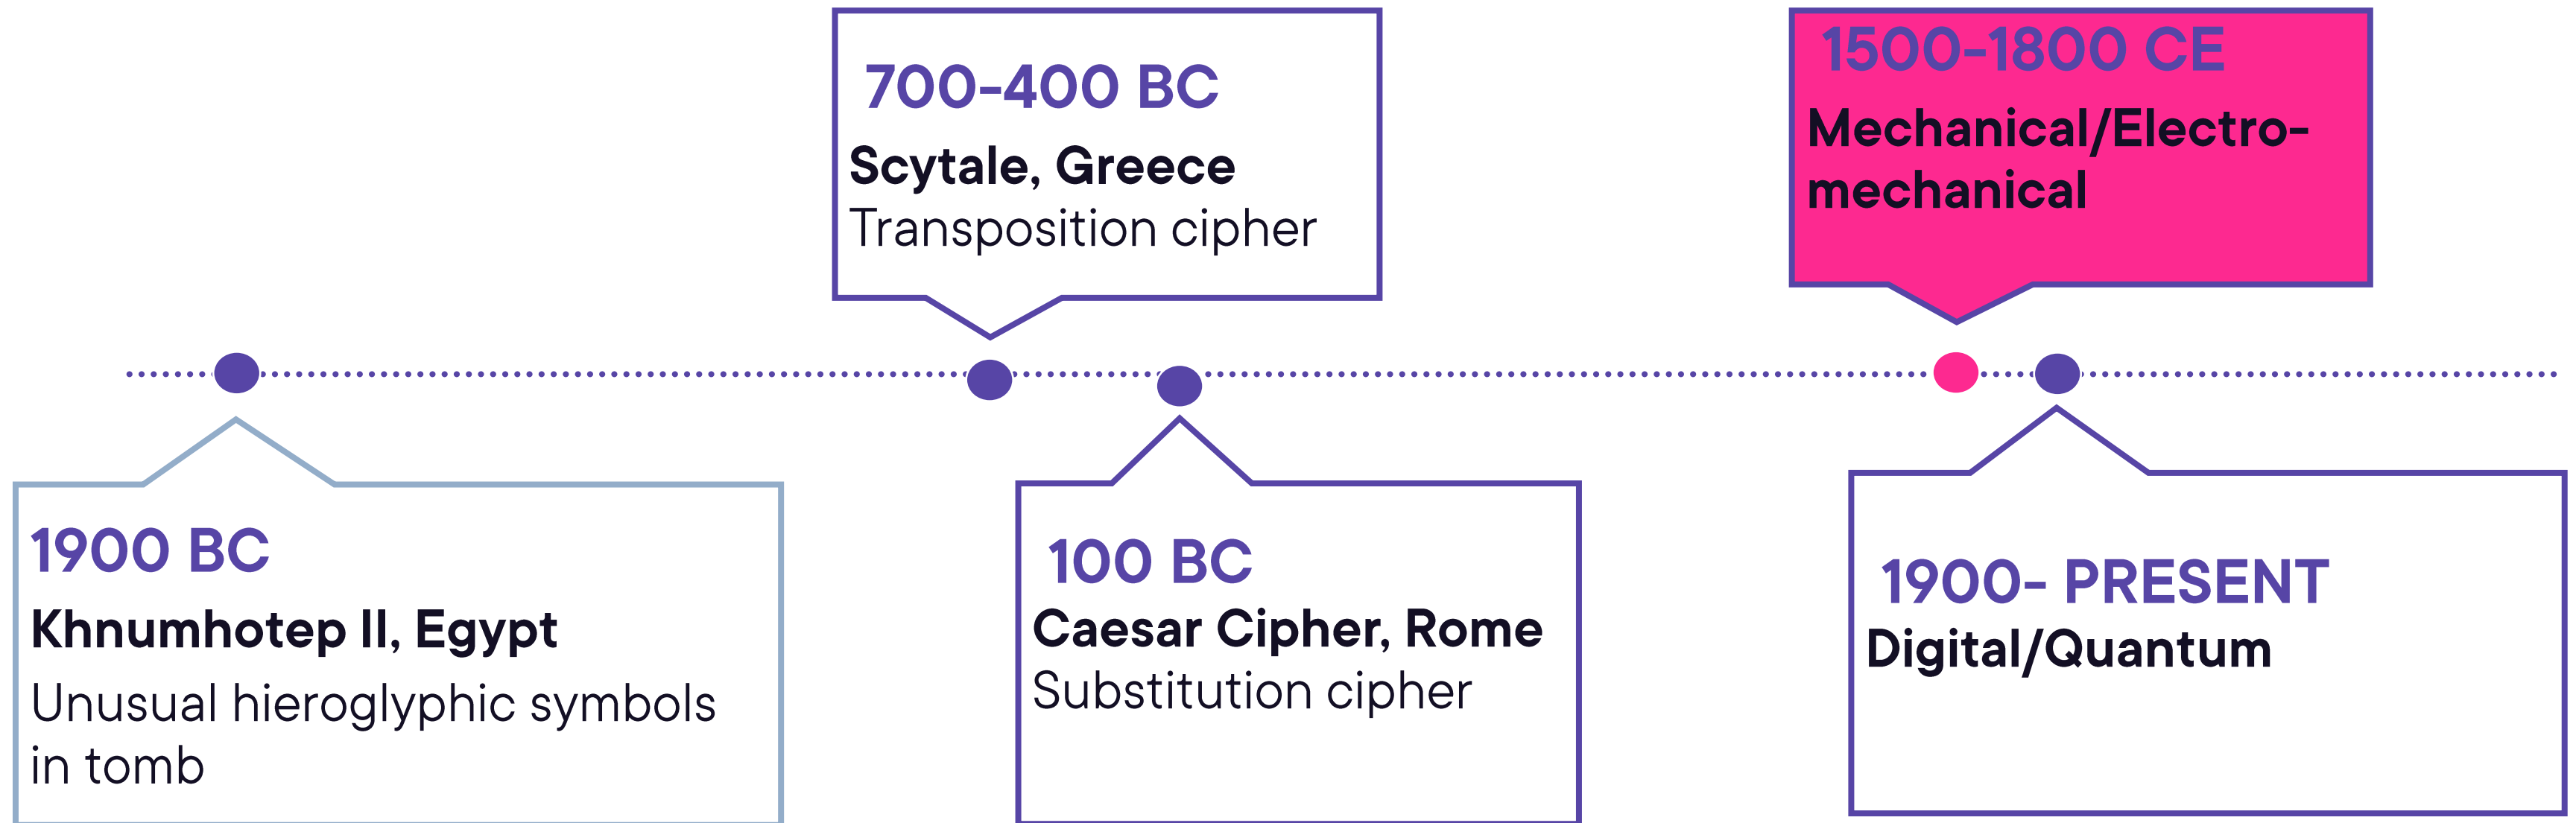

Caesar Cipher

Ciphertext

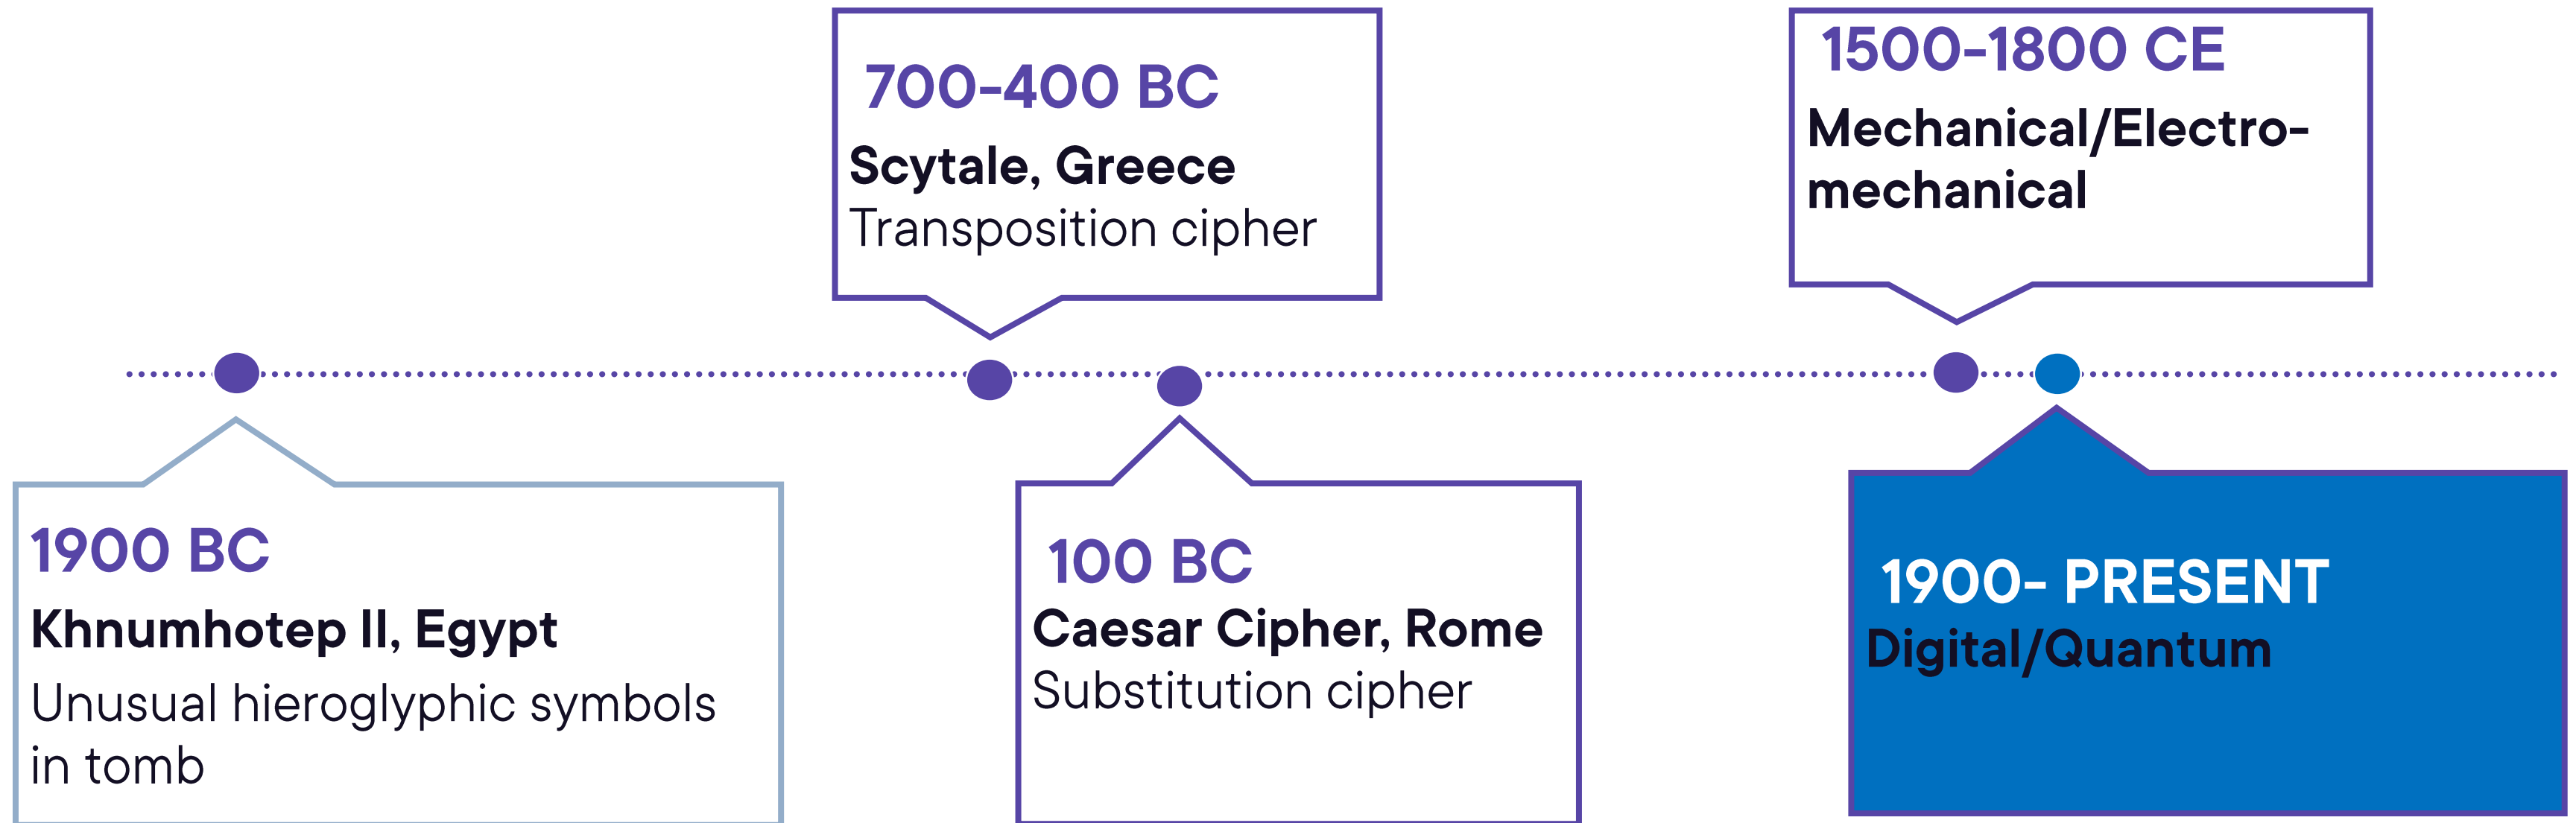

History of Significant Cryptographic Advances

History of Significant Cryptographic Advances

Quantum key distribution

Cryptography entropy

Quantum cryptography/cryptanalysis entropic effect

NIST PQC (Post-Quantum Cryptography)

- CRYSTALS-Kyber
- CRYSTALS-Dilithium
- Falcon
- SPHINCS+

Demystification of Cryptography

Only Three Types of Keys

Symmetric Keys

Same key used for encryption
is used for decryption.

Asymmetric Keys

Private and public key pair.

Demystification of Asymmetric Encryption

1.) Process Order

When one half of key-pair encrypts the other decrypts

2.) Public Key

Encryption objective is confidentiality and access control

3.) Private Key

Encryption objective is integrity, authenticity, and non-repudiation

4.) Digital Signature

Private key (encrypting) signing a digest

5.) Digital Certificate

Digital document containing DS of CA and public key of owner

Single key
Shared key
Secret key
Shared secret key
Session key

Alternative Names for a Symmetric Key

**Don't call a symmetric key a
private key!**

Use Cases for Three Keys

Confidentiality – Public key and Symmetric key

Access control – Public key and Symmetric key

Authenticity – Private key

Integrity – Private key and Symmetric keyed-hash

Non-repudiation – Private key

Data Sensitivity Protection Requirements

Confidentiality vs. Privacy

Privacy
Related to people

Confidentiality
Related to resources

Intellectual property
Competitive advantage
Business data/information
Classification and categorization
ISO/IEC and NIST standards

Confidentiality Business Requirements

**Personally Identifiable
Information (PII)**

**Direct and indirect
identifiers**

Human rights

Legal and regulatory

PCI-DSS

Privacy Business Requirements
