

# Create a Trojan Server using Theef RAT Trojan

***ILABS***  
***CEH PRACTICAL***

@mmar

## Aim

Theef is a Remote Access Trojan written in Delphi. It allows remote attackers access to the system via port 9871 and 6703. Theef is a Windows-based application for both client and server. The Theef server is a virus that you install on a target computer, and the Theef client is what you then use to control the virus.

Here, we will use the theef Trojan to gain control over a victim machine. We will use the Windows 11 (10.10.1.11) machine as the attacker machine and the Windows Server 2022 (10.10.1.22) machine as the victim machine.
