- Remote Server 14 hops → high-latency

<https://t.me/learningnets>

- Remote Server 14 hops → high-latency
- KVM with Ubuntu VM

<https://t.me/learningnets>

- Remote Server 14 hops → high-latency
- KVM with Ubuntu VM
- Nginx with PHP, Memcached and MySQL installed

<https://t.me/learningnets>

- Remote Server 14 hops → high-latency
- KVM with Ubuntu VM
- Nginx with PHP, Memcached and MySQL installed
- Use pyshark to capture web requests

<https://t.me/learningnets>

- Use **amplification** across the internet

<https://t.me/learningnets>

- Use **amplification** across the internet
- Transmit **multiple** bits at once

<https://t.me/learningnets>

- Use **amplification** across the internet
- Transmit **multiple** bits at once
- Use **asyncio**
- Covert channel across internet is **34.41 B/h**

<https://t.me/learningnets>

Attacks	Location	Environment	Local	Type	Attack Type	Performance
Suzaki	Co-located	Cross-VM	Yes	Native	Fingerprinting	-
Owens	Co-located	Cross-VM	Yes	Native	Fingerprinting	-
Gruss	Remote	Browser/Cross-VM	Yes	JS	Fingerprinting	-
Barresi	Remote	Cross-VM	Yes	Native	ASLR break	8.7 days
Bosman	Remote	Browser	Yes	JS	Bytewise leakage, ASLR break, Rowhammer	2.75 h
Lindemann	Co-located	Cross-VM	Yes	Native	Fingerprinting	1.8 h
Kim	Co-located	Cross-VM	Yes	Native	KASLR break	12 min
Our work	Remote	Internet/LAN	No	None	Bytewise leakage, KASLR break, Fingerprinting	1.5 B/h (LAN) / 4 min / 166.51 s

<https://t.me/learningnets>

- C1: Remotely **amplify latencies** for non-repeatable events.

<https://t.me/learningnets>

- C1: Remotely **amplify latencies** for non-repeatable events.
- C2: Trigger and observe COW-pagefaults in a victim domain that **shares no memory with any attacker domain**.

<https://t.me/learningnets>

- C1: Remotely **amplify latencies** for non-repeatable events.
- C2: Trigger and observe COW-pagefaults in a victim domain that **shares no memory with any attacker domain**.
- C3: Find remote request paths that do not only keep attacker-controlled data in memory but also provide the attacker with **control over alignment and in-memory** representation.

<https://t.me/learningnets>

C1: Amplification

<https://t.me/learningnets>

C2: Trigger-COW pagefaults without shared memory

- A web application provides a **file-upload**

<https://t.me/learningnets>

C2: Trigger-COW pagefaults without shared memory

- A web application provides a **file-upload**
- Data is **cached** in RAM e.g., Memcached

<https://t.me/learningnets>

C2: Trigger-COW pagefaults without shared memory

- A web application provides a **file-upload**
- Data is **cached** in RAM e.g., Memcached
- The attacker can **update/overwrite** the uploaded data → trigger pagefaults

<https://t.me/learningnets>

C2: Trigger-COW pagefaults without shared memory

<https://t.me/learningnets>

C2: Fingerprint a system library

- Fingerprint a system by uploading memory

<https://t.me/learningnets>

C2: Fingerprint a system library

- Fingerprint a system by uploading memory
- Use Memcached to store and replace

<https://t.me/learningnets>

C2: Fingerprint a system library

- Fingerprint a system by uploading memory
- Use Memcached to store and replace
- Page-alignment unknown therefore we guess all possible offsets

<https://t.me/learningnets>

C2: Fingerprint a system library

- Fingerprint a system by uploading memory
- Use Memcached to store and replace
- Page-alignment unknown therefore we guess all possible offsets
- Race with other users via re-allocation on free-list

<https://t.me/learningnets>

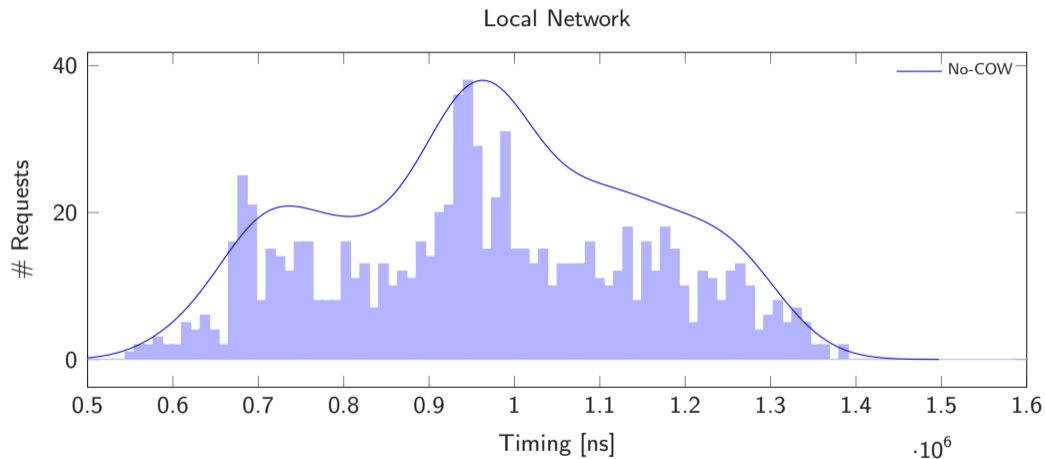

C2: Fingerprint a system library

- Fingerprint a system by uploading memory
- Use Memcached to store and replace
- Page-alignment unknown therefore we guess all possible offsets
- Race with other users via re-allocation on free-list
- If re-assigned overwrite page and trigger COW-pagefault

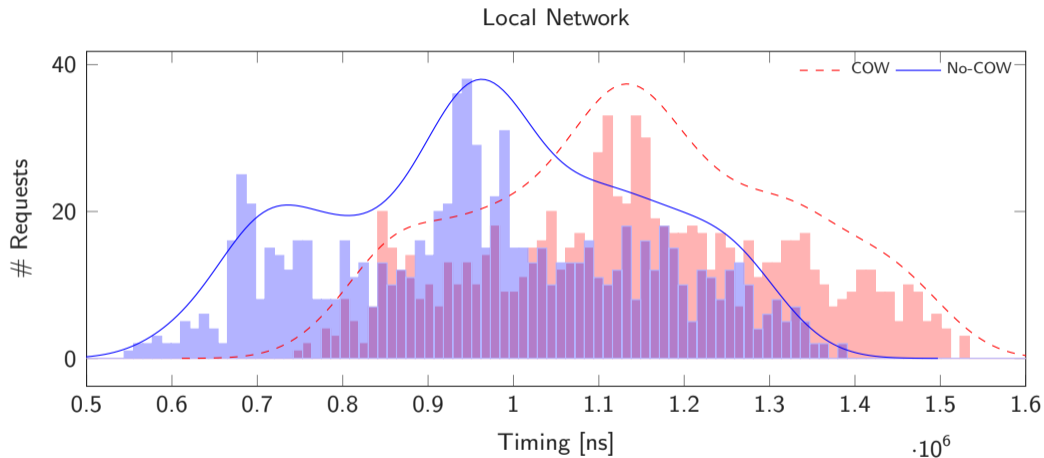

<https://t.me/learningnets>

- **Disable** memory deduplication

<https://t.me/learningnets>

- **Disable** memory deduplication
- Apply **same behaviour** for every memory write (VUsion)

<https://t.me/learningnets>

- **Disable** memory deduplication
- Apply **same behaviour** for every memory write (VUsion)
- Only deduplicate **zero pages**

<https://t.me/learningnets>

- **Disable** memory deduplication
- Apply **same behaviour** for every memory write (VUsion)
- Only deduplicate **zero pages**
- Detect attack on network layer with **packet inspection**

<https://t.me/learningnets>

- **Disable** memory deduplication
- Apply **same behaviour** for every memory write (VUsion)
- Only deduplicate **zero pages**
- Detect attack on network layer with **packet inspection**
- Encode pages with different **random salts**

<https://t.me/learningnets>

<https://t.me/learningnets>

<https://t.me/learningnets>

- Remote Attack was assigned **CVE-2021-3714**

<https://t.me/learningnets>

- Remote Attack was assigned **CVE-2021-3714**
- Remotely **fingerprinting** of libraries

<https://t.me/learningnets>

- Remote Attack was assigned **CVE-2021-3714**
- Remotely **fingerprinting** of libraries
- Break **KASLR** in ≤ 4 minutes across the internet

<https://t.me/learningnets>

- Remote Attack was assigned **CVE-2021-3714**
- Remotely **fingerprinting** of libraries
- Break **KASLR** in ≤ 4 minutes across the internet
- Leak **database records** via InnoDB reorganization

<https://t.me/learningnets>

- Remote Attack was assigned **CVE-2021-3714**
- Remotely **fingerprinting** of libraries
- Break **KASLR** in ≤ 4 minutes across the internet
- Leak **database records** via InnoDB reorganization
- Red Hat developed a probabilistic **mitigation** as opt-in for Linux kernel
