Administrative units in Azure Active Directory

- An administrative unit is an Azure AD resource that can be a container for other Azure AD resources.
- An administrative unit can contain only users and groups.
- Administrative units restrict permissions in a role to any portion of your organization that you define.
- You could, for example, use administrative units to delegate the Helpdesk Administrator role to regional support specialists, so they can manage users only in the region that they support.

Deployment Example

It can be useful to restrict administrative scope by using administrative units in organizations that are made up of independent divisions of any kind. Consider the example of a large university that's made up of many autonomous schools (School of Business, School of Engineering, and so on). Each school has a team of IT admins who control access, manage users, and set policies for their school.

A central administrator could:

- Create a role with administrative permissions over only Azure AD users in the business school administrative unit.
- Create an administrative unit for the School of Business.
- Populate the administrative unit with only the business school students and staff.
- Add the business school IT team to the role, along with its scope.

License Requirements

To use administrative units, you need an Azure Active Directory Premium license for each administrative unit admin, and Azure Active Directory Free licenses for administrative unit members.
