

# Lab Project : Password Sniffer

Using DLL Injection with API Hooking and Persistence to Steal Disk  
Encryption Password

# Objective

- To write a Trojan that starts whenever the PC starts and monitors a disk encryption software called VeraCrypt.
- When the user enters a password to mount a drive, the Trojan will steal the password and save it to a file.
- Something like a keylogger, except that this one monitors a specific program. i.e. VeraCrypt.

# How it works

Thank you
