

Office Password Cracking with John

(Recover Word, Excel, PowerPoint Passwords)

John The Ripper (JTR) is one of the most popular password cracking tools available in most Penetration testing Linux distributions like Kali Linux, Parrot OS, etc. The tool has a user-friendly command-line interface and the ability to detect most password hash types. This lesson will dive into John the Ripper, show you how it works, and explain why you need it for security testing

CONCEPT

Step-1

- Get the Hash from the office file

Step-2

- Crack the hash with John

You must have Kali Linux Installed in Vmware or Virtual Box

Step- 1

- ❖ Prepare a password protected word file

Save the word file in Windows, Go to general options and give the password

Step- 2

- ❖ Copy the file from Windows machine to Kali

You can directly copy files to Vmware machine or you can use USB to transfer the file

Step- 3

- ❖ Get the hash of the document with following command

```
office2john crackme2.docx > hash2.txt
```

Here :

- Crackme2.docx is the password protected file
- Hash2.txt is the txt file that will contain our hash that is required to be cracked

Step- 3

- ❖ Get the hash of the document with following command

```
office2john crackme2.docx > hash2.txt
```

```
(kali@kali)-[~]  
└─$ office2john crackme2.docx >hash2.txt
```

Step- 4

- ❖ Now crack the password with following command

```
John hash2.txt
```

Here :

- Hash2.txt file is the file that contains our hash for the document file

By default it will first try with the **single crack attack** (check the combination of file names for passwords, then the **default dictionary** and then go for **brute force**)

Step- 4

- ❖ Now crack the password with following command

```
John hash2.txt
```

```
(kali@kali)-[~]
└─$ john hash2.txt
Using default input encoding: UTF-8
Loaded 1 password hash (Office, 2007/2010/2013 [SHA1 32/32 / SHA512 32/32 AES])
Cost 1 (MS Office version) is 2013 for all loaded hashes
Cost 2 (iteration count) is 100000 for all loaded hashes
Will run 2 OpenMP threads
Proceeding with single, rules:Single
Proceeding with wordlist:/usr/share/john/password.lst
```

```
Almost done: Processing the remaining buffered candidate passwords, if any.
Proceeding with wordlist:/usr/share/john/password.lst
123 (crackme2.docx)
1g 0:00:09:56 DONE 2/3 (2022-08-18 19:47) 0.001675g/s 20.87p/s 20.87c/s 20.87C/s a1b2c3..123
Use the "--show" option to display all of the cracked passwords reliably
Session completed.
```

Step- 5

- ❖ To check the cracked password

```
John --show hash2.txt
```

```
(kali@kali)-[~]  
└─$ john --show hash2.txt  
crackme2.docx:123  
  
1 password hash cracked, 0 left
```

John Additional Attacks

Multi-Attack

- ❖ To run john faster and use it with multiple processes

```
John hash2.txt --fork=3
```

Here :

- fork=3 tells john that three processes be created for cracking passwords (Useful in multicore processor)

```
(kali@kali)-[~]
└─$ john hash.txt --fork=3
Using default input encoding: UTF-8
Loaded 1 password hash (Office, 2007/2010/2013 [SHA1 32/32 / SHA512 32/32 AES])
Cost 1 (MS Office version) is 2013 for all loaded hashes
Cost 2 (iteration count) is 100000 for all loaded hashes
Node numbers 1-3 of 3 (fork)
Warning: Only 1 candidate buffered for the current salt. Minimum 8 needed for performance
```

Dictionary Attack

- ❖ Use only inbuilt dictionary file

```
john --w hash2.txt
```

(Will use inbuilt dictionary)

```
(kali@kali)-[~]
└─$ john --w hash2.txt
Using default input encoding: UTF-8
Loaded 1 password hash (Office, 2007/2010/2013 [SHA1 32/32 / SHA512 32/32 AES])
Cost 1 (MS Office version) is 2013 for all loaded hashes
Cost 2 (iteration count) is 100000 for all loaded hashes
Will run 2 OpenMP threads
Proceeding with wordlist:/usr/share/john/password.lst
Press 'q' or Ctrl-C to abort, almost any other key for status
123 (crackme2.docx)
1g 0:00:00:00 DONE (2022-08-18 20:10) 1.190g/s 23.80p/s 23.80c/s 23.80C/s a1b2c3..123
Use the "--show" option to display all of the cracked passwords reliably
Session completed.
```

Dictionary Attack

❖ To use rockyou dictionary, uncompress the file

- `gunzip /usr/share/wordlists/rockyou.txt.gz`
- `ls /usr/share/wordlists/`

```
(kali㉿kali)-[~]  
└─$ gunzip /usr/share/wordlists/rockyou.txt.gz
```

```
(kali㉿kali)-[~]  
└─$ ls /usr/share/wordlists/  
  
dirb  dirbuster  fasttrack.txt  fern-wifi  metasploit  nmap.lst  rockyou.txt  wfuzz
```

Dictionary Attack

❖ To use the rockyou.txt dictionary file

```
john -w="/usr/share/wordlists/rockyou.txt" hash.txt
```

Here :

- --/usr/share/wordlists/rockyou.txt is the dictionary
- Hash.txt is the hash, we are aiming to crack

Dictionary Attack

❖ To use the rockyou.txt dictionary file

```
john -w="/usr/share/wordlists/rockyou.txt" hash.txt
```

```
(kali@kali)-[~]
└─$ john -w=/usr/share/wordlists/rockyou.txt hash.txt

Using default input encoding: UTF-8
Loaded 1 password hash (Office, 2007/2010/2013 [SHA1 32/32 / SHA512 32/32 AES])
Cost 1 (MS Office version) is 2013 for all loaded hashes
Cost 2 (iteration count) is 100000 for all loaded hashes
Will run 2 OpenMP threads

Press 'q' or Ctrl-C to abort, almost any other key for status
123456          (crackme.docx)
1g 0:00:00:00 DONE (2022-08-18 19:58) 11.11g/s 22.22p/s 22.22c/s 22.22C/s 123456..12345
Use the "--show" option to display all of the cracked passwords reliably
Session completed.
```

Mask Attack

- ❖ If you know number of digits or type of password, you can use the masking attack

```
john --mask='?d?d?d' hash2.txt
```

Here :

- ?d tells that there is a digit.
- ?d?d?d will check all combination of 3 digits
- You can specify ?l for lower case characters or ?u for upper case characters

Mask Attack

```
john --mask='?d?d?d' hash2.txt
```

```
(kali㉿kali)-[~]
└─$ john --mask='?d?d?d' hash2.txt

The system

Using default input encoding: UTF-8
Loaded 1 password hash (Office, 2007/2010/2013 [SHA1 32/32 / SHA512 32/32 AES])
Cost 1 (MS Office version) is 2013 for all loaded hashes
Cost 2 (iteration count) is 100000 for all loaded hashes
Will run 2 OpenMP threads
Press 'q' or Ctrl-C to abort, almost any other key for status
123 (crackme2.docx)
1g 0:00:00:13 DONE (2022-08-18 20:07) 0.07581g/s 24.41p/s 24.41c/s 24.41C/s 123..023
Use the "--show" option to display all of the cracked passwords reliably
Session completed.
```

Mask Attack

- ❖ To clear John cache to remove saved passwords

```
find -name "john.pot"  
Rm ./john/john.pot
```

```
(kali㉿kali)-[~]  
└─$ find -name "john.pot"  
./john/john.pot  
  
(kali㉿kali)-[~]  
└─$ sudo rm ./john/john.pot
```
