

Introduction to K Nearest Neighbors

Reading Assignment

Complete Chapter 4
Introduction to Statistical Learning
By Gareth James, et al.

K Nearest Neighbors is a **classification** algorithm that operates on a very simple principle.

It is best shown through example!

Imagine we had some imaginary data on Dogs and Horses, with heights and weights.

KNN

New datapoint:
Is it a horse or a dog?

New datapoint:
Is it a horse or a dog?

New datapoint:
Is it a horse or a dog?

Training Algorithm:

1. Store all the Data

Prediction Algorithm:

1. Calculate the distance from x to all points in your data
2. Sort the points in your data by increasing distance from x
3. Predict the majority label of the “ k ” closest points

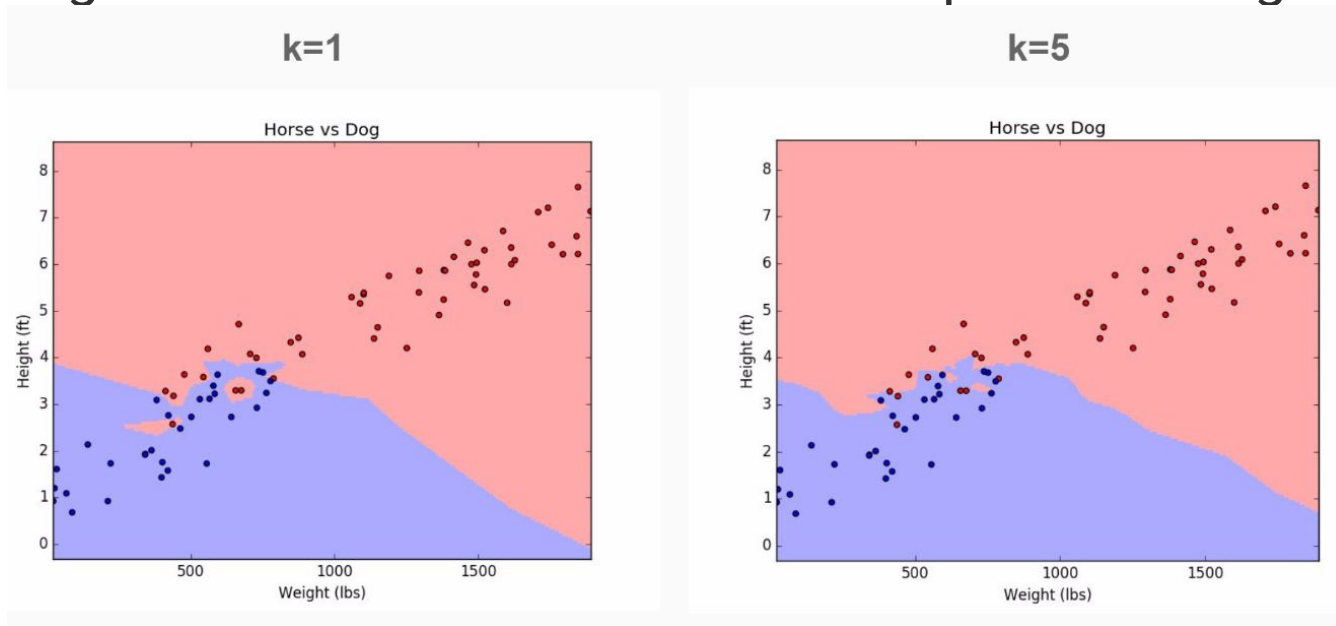

Choosing a K will affect what class a new point is assigned to:

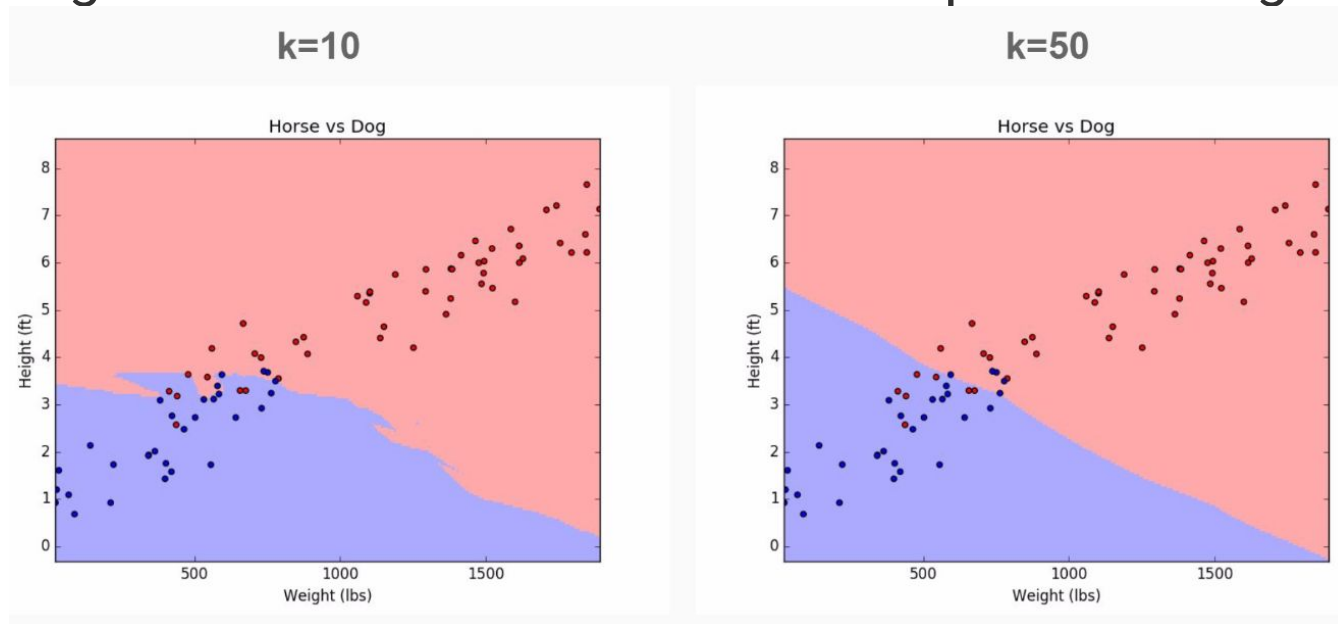

Choosing a K will affect what class a new point is assigned to:

Choosing a K will affect what class a new point is assigned to:

Choosing a K will affect what class a new point is assigned to:

Pros

- Very simple
- Training is trivial
- Works with any number of classes
- Easy to add more data
- Few parameters
 - K
 - Distance Metric

Cons

- High Prediction Cost (worse for large data sets)
- Not good with high dimensional data
- Categorical Features don't work well
